SOME NEW ELEMENTS IN POSITIONING ANCHORAGE AREA FOR PASSENGER CRUISERS NEAR PORT OF DUBROVNIK

ABSTRACT

There are several factors to be considered while creating an anchorage area for cruising ships. Mandatory elements included in the analyses of the anchorage area are: security factor, aquatorium factor, ship factor, environmental pollution factor, anchorage occupancy factor and legal issues. Considering many specifics of the city of Dubrovnik and the surrounding area some new principles had to be included in order to find the most convenient solution for the new anchorage area. These principles are proportionality, traditionality and diversity applied to some aspects of cruisers and anchoring aquatorium. With such approach it was possible to position the optimal area for anchoring near very sensitive old city of Dubrovnik and satisfy all the subjects included in that problem.

KEYWORDS

Dubrovnik, anchorage, size of the cruiser, security, number of passengers

1. INTRODUCTION

The history of Dubrovnik port goes way back into the past. It has existed since the ancient times together with the neighbouring anchorage near the island of Lokrum. It is hard to estimate when passenger cruising traffic started but no doubt it was long time ago. Many pilgrimages to the Holly Land used to stop in Dubrovnik and also visit the Benedictines on the island of Lokrum.

New technologies in shipbuilding and maritime industry influenced the development of new, cruising industry, that will bring economic prosperity to the city of Dubrovnik. At the end of the 19th century anchorage beside the port was frequently visited by the big passenger cruisers. In September 1898 a huge French steam cruiser "Oriana" anchored near the island of Lokrum, bringing French tourists. Tradition of big steamers anchoring near Dubrovnik continued in 20th century with motor cruisers.

Over time the size of the ships has increased, the frequency of visits has changed and more ships used to anchor at the same time. Parallel with the change in ships, urban area and tourist area in the close vicinity of the anchorage have developed. Therefore, the initiative for changing position of the anchorage area was seriously taken into consideration by the local and state government. All the relevant factors for creation of the new anchorage area were grouped as follows: security factor, aquatorium factor, ship factor, environmental pollution factor and legal issues. Moreover, beside these factors, it was necessary to introduce principles of proportionality, traditionality and diversity in order to find optimal solution for anchoring.

2. AQUATORIUM FACTOR

Current anchorage (broken line in Figure 1) is located between the island of Lokrum and the mainland (Lokrum sea passage). The average length of the anchorage field is 1270 m; with average width of 470 m. Approximate anchorage area computed by planimetric methods occupies 617,000 m².

Some New Elements in Positioning Anchorage Area for Passenger Cruisers Near Port of Dubrovnik

Depth of the anchorage are presented in Figure 2 through 4, typical cross-sections: Longitudinal cross-section A. (northwest-southeast); transversal cross-section B. (Hotel "Villa Dubrovnik" - Cape Križ), C. (Sv. Jakov - pier at Bocina) and D. (Cape Mala Orsula - South cape Portoc). Longitudinally and transversally depth increases from 20 to 45 m without any sudden changes. The bottom consists mostly of sand and mud thus providing excellent anchor ground.

3. ANCHORAGE OCCUPANCY FACTOR

Figure 3 presents occupancy of the anchorage through the summer months of the season 2004. Free anchorage means no ships anchored, and occupied anchorage means one or more ships anchored. It is obvious that anchorage was completely free for about 1/3 of the busiest months. For the rest of the season more free days were available.

4. SHIP FACTOR

The total number of 38 ships anchored 149 times near the old port of Dubrovnik in 2004. Ships were dif-

</table>
different in age, type, propulsion, power, size, number of passengers, cruising class, etc. Some ships visited Dubrovnik only once and some of them did it several times.

5. DIVERSITY OF SHIPS

Analysis of Table 1 shows significant differences in the main characteristics of the ships within the total population. Therefore, it makes sense to differentiate the ships in two groups, such as, big and small cruisers. Big cruisers are longer than 250 between big and small cruiser meters and small cruisers are shorter than 150 meters. On average the group of big cruisers is 2.42 times longer than the group of small cruisers.

The difference in length of 2.42 times makes big cruiser even 25.61 times more powerful and 19.84 times bigger. Moreover big cruiser accommodates 16.69 times more passengers than a small one. From the environmental point of view big cruisers are less convenient because the amount of every pollutant increases exponentially as power, size and number of passengers increase. From the economic point of view big cruisers are more convenient because of bringing more tourists and thus more money for the community.

6. PROPORTIONALITY AND TRADITIONALISM CONSIDERING NEW ANCHORAGE POSITION

Obviously, the important elements in positioning the new anchorage area are diversity of the cruisers, relatively small anchorage area, constant increase in the number of ships and uniqueness of Dubrovnik. Considering all the relevant factors, it is very difficult to design a new anchorage area without dividing ships into two groups and dividing the area into two fields. Smaller area c is supposed to get small cruisers, while the bigger areas d and b get big cruisers. By using the principle of proportionality, the size of the ships and the size of areas are proportional in terms of area acreage, area depth, number of ships, frequency of anchoring, number of passengers and technical data of the cruisers. Most of the small cruisers are sailing cruisers thus contributing the strong and bright maritime tradition of Dubrovnik.
7. CONCLUSION

It is not an easy task to design the anchorage area near the old port of Dubrovnik because of the delicate heritage from the past and the importance of the tourist facilities of today. After the implementation of the traditional factors, the solution for the anchorage area was not optimal. However, a convenient solution was found after the introduction of some new elements into the research. These elements are proportionality, traditionality and diversity applied to some aspects of ships and anchoring aquatorium. In order to meet all the requirements the anchorage area is extended and divided in two parts. The smaller part, closer to the city proposed for small cruisers and the bigger part, far from the city proposed for big cruisers.

SAŽETAK

NEKI NOVI ČIMBENICI U ODREĐIVANJU POLOŽAJA SIDRISTA ZA CRUISERE U BLIZINI GRADSKE LUKE U DUBROVNIKU

Postoji nekoliko faktora koji se moraju uzeti u obzir kod osmišljavanja sidristra za putničke brodove. Nezaobilazni elementi analize sidrišta su faktor sigurnosti, karakteristike akvatorija, karakteristike brodova, faktor onečitčavanja okoliša, faktor zauzetosti sidrišta i važeće zakonske norme. Uzimajući u obzir specifičnosti Dubrovnika i okolnog područja neka nova načela su se uvela u cilju iznalaženja najpogodnijeg područja za sidrenje putničkih brodova. Ta načela su proporcionalnost; tradicionalnost i raznolikost; primijenjena na neke elemente brodova i akvatorija u kojem ti brodovi sidre.

Takvim pristupom pronašla se optimalna zona sidrenja u posebno osjetljivom području pored staroga grada koja je zadovoljila sve subjekte zainteresirane za tu problematiku.
